

ID Mismatch Pattern — Llama-Med L25 × id ($\alpha=+2$, $n=50/\text{template}$)

(a) Logprob change

(b) b_{rank} change

■ mismatch template (Δ_{lp} NS, $\Delta b_{rank} < 0$) ■ non-mismatch

Mismatch pattern: 3/9 templates show Δ_{lp} not significant but $\Delta b_{rank} < 0$ significant.
Logprob mean is preserved while the gold token's rank degrades — a feature-specific, sub-mean effect on PII recoverability.
